

Nora Maione

My website focuses on introducing who I am as a student, athlete, and developing marketing professional. It serves as a personal portfolio that brings together my academic work, leadership roles, job experience, and interests all in one place. Many professional sites look polished but also feel distant which is why I decided to choose a simpler layout so visitors could immediately understand my background without feeling overwhelmed by too much text or too many design elements.

When I created the site, my main goal was to make it approachable and clear. I wanted potential employers, professors, and coaches to see a complete picture of me that includes both strengths and real experiences that have shaped them. I relied on short sections, clean formatting, and a conversational writing style so the site would connect with visitors of all different ages and backgrounds. I believe this strategy worked well for me because it communicates professionalism while still feeling personal. It also reflects the balance I try to maintain in my life, which makes the site feel consistent with who I am offline. That is one of my favorite parts!

To create the website, I used my computer along with GoDaddy's online website builder. The hardware was basic, I just used my computer (MacBook), which was enough for everything I needed to do. The software included the GoDaddy web builder, its built in editing tools, and the hosting platform that displays the site online. These worked very smoothly for me overall and made the process simple and more structured because the builder handles coding and formatting automatically.

There are some other tools that I think could improve the site in the future. For example, using a more advanced design program like Canva might help create more polished graphics or icons. I have used Canva in the past and always liked how the final presentation turned out. It

was always aesthetically pleasing to look at. Even with these flaws, the tools did support clear communication by helping me organize the information in a way that is easy to read and understand and I really appreciated that.

The main types of data produced by my website are the page views, clicks, and user behavior data created when people browse the site. GoDaddy collects these through its analytics dashboard, which I shared in a previous assignment. This data is produced automatically whenever a visitor loads a page, interacts with a button, or stays on a section for a certain amount of time. The data consumed by the website includes everything from the text and images to the links. The website uses this data to display information and guide visitors through various topics.

Along with that, there are specific social assumptions built into the exchange of data on the site. People visiting are expected to have basic internet skills, to understand the common structure of websites, and to know how to navigate through sections. They are also expected to be interested in improving life skills and open to reading short minimal content. The spread of data on the site can have a few consequences. The site's data could be misunderstood if someone expects professional counseling or advanced psychological advice, since the content is meant to be more simple and general. On the positive side, it can help people learn tools that might make their daily lives easier.

The audience for my website includes employers, professors, coaches, and students. Demographically, this group may range from late teens/early twenties to older professionals in business, athletics, marketing, or even education. Many visitors will have experience reviewing resumes or portfolios, but some may come with less background and simply want to learn more about balancing sports and academics. With that, there are additional types of audience members

I would like to reach, such as potential internship supervisors or other student athletes looking for examples of personal branding. I would also like the site to reach professionals in marketing who may be open to offering just some simple guidance or opportunities.

There are also social expectations connected to these audiences. Visitors expect clear information, accurate descriptions of my experience, and a layout that makes sense. They also expect a certain level of professionalism, since the website represents my early career identity. The results of reaching these audiences can be positive because the site has the ability to help create connections or inspire others. Overall, the audience shapes how the site is interpreted and used, which is why clarity and tone were very important to me while creating it.

The website is influenced by GoDaddy's procedures and policies, including their rules for hosting, privacy, security, and acceptable content. These policies exist to protect both the creator, me, and the visitors, my audience, to make sure that the site stays safe and stable. They also ensure that the site follows legal expectations for privacy and intellectual property. The social conditions behind these policies come from the need to keep users' information protected and to prevent harmful or misleading content from being published. These procedures serve the purpose of keeping the system reliable and trustworthy. The consequences of these policies include improved user confidence and a more consistent experience for anyone visiting. They also limit certain design choices, since the site must fit within GoDaddy's standards.

The main feedback I received while creating the website came from previewing the pages myself and noticing what looked cluttered or confusing. My "experience" page originally was very cluttered with lots of words in not a very big space. I saw that and knew I needed to change it. Instead of leaving all of the headers and descriptions of my experience I just decided to link

my resume where all of that and more was able to be found in one place, organized and easier to read. Being able to provide a link instead of paragraphs was definitely less of an eye sore. After that I then just decided to link everything else I wanted to show and I believe it will not only be better to look at but also easier for my audience to click on a link to take them to another more organized site. This helped me simplify the layout and reword certain sections so they were easier to read. I also used the GoDaddy preview tool to see how the site looked before I published it. This was able to help me adjust some spacing and formatting decisions. Although I have not collected much direct feedback from many other users yet, I plan to gather more by sharing the site with friends and classmates.

Overall, in the future, I think I would benefit from adding a short survey at the end of my website so visitors can leave comments. Checking analytics data will give me broad feedback by showing which pages people visit most and where they stop reading, but I think more direct personal feedback will also be helpful. All of this information will help me continue adjusting the site so that it better serves the audience.
